

The Healthy Minds Study Codebook

About the Healthy Minds Study Data Sets

- **Background:** The Healthy Minds Study is a web-based survey study of college students' mental health and help-seeking behavior. The study was first developed in 2005 at the University of Michigan School of Public Health by Daniel Eisenberg, Ezra Golberstein, Sarah Gollust, and Jennifer Hefner. The survey has been administered by Survey Sciences Group, LLC (Ann Arbor, Michigan) from 2005-2013 and since then by the HMS research team at University of Michigan. The initial development of the study was funded by the University of Michigan and Blue Cross Blue Shield of Michigan Foundation. Subsequent years of the study have been funded by the participating colleges and universities, which receive data reports and data sets in return for a fee that covers the cost of participation. All colleges and universities are welcome to join the study in any year; more information is at www.healthymindsnetwork.org.
- **Study design:** At each participating campus, a random sample is selected from the full student population. At most campuses, this initial sample is 4,000 students, although it is obviously smaller at campuses with fewer than 4,000 students. In 2007 and 2009, students were invited via postal mail (with a \$2 incentive) as well as up to four email reminders linking to the survey. Since 2010 recruitment has been via email only. All students are informed that they are entered into a cash sweepstakes drawing, regardless of their participation.
- **Sample sizes and response rates:**

	2007	2009	2010	2011	2012	2013	2014	2014-2015
Number of schools	13	15	26	11	31	17	20	17
Number of students in initial sample	12,997	19,110	89,065	33,257	121,841	111,670	60,634	70,727
Overall participation rate	42.7	42.2	25.3	26.3	23.2	16.0	29.0	23.1
Range of school-level completion rates	32.6-59.3	26.7-50.1	3.03-49.1	10.7-45.5	8.2-44.3	1.6-43.2	6.0-38.0	15.0-42.0

- **Sample weights:** A potential concern in any survey study is that those who respond to the survey will not be fully representative of the population from which they are drawn. In this study, we can at least be confident that those who were invited to fill out the survey were representative of the full student population, because these students were randomly selected from the full list of currently enrolled students. But it is still possible that those who completed the survey were different in important ways from those who did not complete the survey. We address this issue by constructing non-response weights using administrative data on full student populations. Most schools are able to provide administrative data about all students who were randomly selected for the study. The analysis of these administrative data, separated from any identifying information, was approved in the IRB application at the University of Michigan and each participating school. We used the following variables, where available, to estimate which types of students were more or less likely to respond to the survey: gender (male, female), race/ethnicity (white, black, Hispanic, Asian, other), academic level (undergraduate, graduate), and grade point average (categorized into: missing or not applicable, 0.01-2.00, 2.01-2.50, 2.51-3.00, 3.01-3.30, 3.31-3.50, 3.51-3.70, 3.71-3.90, 3.91-4.30). In the national sample, overall, the largest differences in response rate are generally for: female students (higher than for male students); graduate students (higher than for undergraduates); and students with higher GPA (higher than for students with lower GPA). We used these variables to estimate the response propensity of each type of student (based on logistic multivariable regressions), and then assigned response propensity weights to each student who completed the survey. The less likely a type of student was to complete the survey, the larger the weight they received in the analysis, such that the weighted estimates are representative of the full student population in terms of the administrative variables available for each institution. Finally, note that these sample weights give equal aggregate weight to each school in the national estimates. An alternative would have been to assign weights in proportion to school size, but we decided that we did not want our overall national estimates to be dominated by schools in our sample with very large enrollments.
- **Protection of human subjects:** This study is approved by the University of Michigan Health Sciences Institutional Review Board (IRB), as well as the IRBs from all other participating institutions. Due to the sensitive nature of the data collected in this study, we have taken several precautions to protect the participants. Perhaps the two main concerns pertain to confidentiality and risk of harm to self or others. To address confidentiality, we have taken the following two measures, among others: first, the study was administered on a secure web site, with no confidential information transmitted by email; second, identifying information used to recruit subjects is always stored separately from any response data. Regarding risks of harm to self or others, the surveys close by thanking the participant and offering a list of both local and national mental health resources, such as the campus psychological counseling center and a national suicide prevention hotline (the exact list of resources was determined by the local study coordinator at each institution). Also, for students who indicate suicidal ideation or behavior in the previous year, the final page of the survey includes a special message encouraging the student to consider the list of resources carefully. In addition, each page of the web survey contains emergency contact numbers.

About the Healthy Minds Study Codebook

- All years=2007, 2009, 2010, 2011, 2012, 2013, 2014, 2014-2015
- Where used, validated screening tools (e.g., the Patient Health Questionnaire) are listed in the *Notes* column
- Acknowledgments: Sarah Ketchen Lipson and Gita Serpuja did much of the work to develop this codebook and format the data sets accordingly. There were also substantial contributions from Katie Beck, Daniel Eisenberg, and Steve Brunwasser.
